

Vendor Dashboard Guide

Vendor Coordinator - Step-by-Step

1) Dashboard purpose

Vendor dashboard handles final coordination: selecting eligible requests, notifying vendors, exporting operational data, and triggering FO notifications.

2) Identify eligible requests

1. Open Vendor dashboard.
2. Use search and date filters.
3. Review pending/eligible request list.
4. Open request details to confirm vehicle eligibility.

3) Vendor notification flow

1. Select request(s).
2. Trigger vendor notification action.
3. System calls backend notification endpoints.
4. Verify `vendorNotified` behavior and notification timestamps.

4) Bulk notification and export

- Bulk mode supports structured row payload generation.
- Export to spreadsheet uses `xlsx` logic for operational sharing.
- Generated exports include city, client, service, vehicle, LTPOC, and LPO details.

5) FO notification flow

- After vendor actions, FO bulk notification can be sent through secured function calls.
- Auth token is applied for protected backend routes where required.

6) Vendor constraints

- Only vendor-stage requests are actionable.
- For bulk requests, payment-approved and non-rejected vehicle subsets are used.
- Already-notified records are prevented from duplicate notifications.

7) Best practices

- Verify vendor mapping (`FleetX`, `WheelsEye`) before sending.
- Confirm recipient emails/environment configuration.
- Export data before final bulk notification for audit.
